

FIG. S5.—Proportion of weed-associated species at Brijuni station with subdivision into different types of weed-association. Note the large share of species strongly associated with seagrass (categories “mainly seagrass”, “lucinids”, “rhizome layer”, and “strictly seagrass”) in the transgressive phase/MFZ, compared to the other phases. IHST= late highstand phase; eHST1= early highstand phase 1; eHST2= early highstand phase 2; MFZ= maximum flooding zone; TST= transgressive phase.
